

Jones Automation – Exercise

Tavor Levine | June 2026

Part A:

1. The payment form does not include a CVV field, which is an important security measure for card verification - Security.
2. The continue button should stop working after the first click to prevent double payments - Functional.
3. It is unknown if the credit card number is checked before submission, if necessary, the transaction should be rejected - Functional.
4. It is unknown whether a check is made regarding the validity of the credit card, if the card has expired, the transaction must be rejected - Functional.
5. It is a good idea to auto-format the credit card number - Usability.
6. An error message should be displayed below fields that are not filled in correctly - Usability.
7. If there are problems with the network, a clear message should be displayed - Reliability.
8. Credit card information should not be stored without the customer's consent - Security.
9. All fields should be marked as indicates required information - Performance.

Part B:

- Test case 1 - Successful completion of payment process with a valid credit card.

Preconditions: User has a valid credit card.

Steps:

Open the payment page

Enter the valid credit card number

Select a month and year that is appropriate for the card

Enter the cardholder's first and last name

Fill in the address to send the receipt

Click Continue

Expected result: The payment is processed successfully, and the user is redirected to the confirmation page.

- Test case 2 - Verify that required field validation works correctly.

Steps:

Leave all required fields empty.

Click Continue.

Expected result: There are validation messages next to required fields and payment is not submitted.

- Test case 3 - Verify that invalid credit card numbers are rejected.

Steps:

Enter an invalid credit card number.

Fill all remaining fields with valid data.

Click Continue.

Expected result: There is an appropriate error message is displayed and payment is not submitted.

Part C:

The most severe issue is missing the CVV field

Solution: A CVV field should be added to the payment form as a mandatory field for all supported card types. The application should validate that the CVV is entered correctly before allowing the user to continue with the payment. For security reasons, the CVV should never be stored after the transaction is completed and should always be transmitted over a secure HTTPS connection. If the field is missing or contains an invalid value, the user should receive a clear validation message explaining how to correct the issue.
